The honor code

(a) Please state the names of people who you worked with for this homework. You can also provide your comments about the homework here.

Cinidy Liu

(b) Please type/write the following sentences yourself and sign at the end. We want to make it *extra* clear that nobody cheats even unintentionally.

I hereby state that all of my solutions were entirely in my words and were written by me. I have not looked at another student's solutions and I have fairly credited all external sources in this write up.

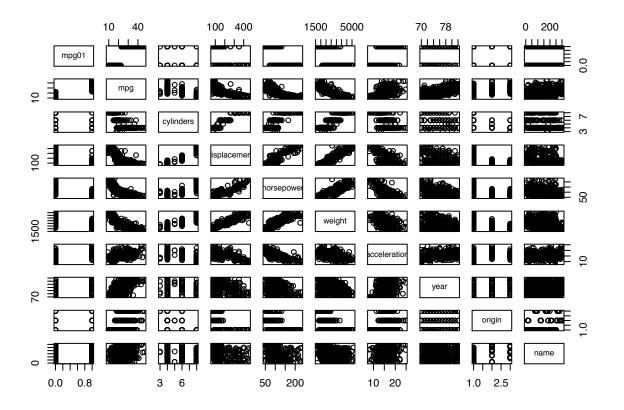

I hereby state that all of my solutions were entirely in my words and were written by me. I have not looked at another student's solutions and I have fairly credited all external sources in this write up.

HW6

caojilin 4/15/2019

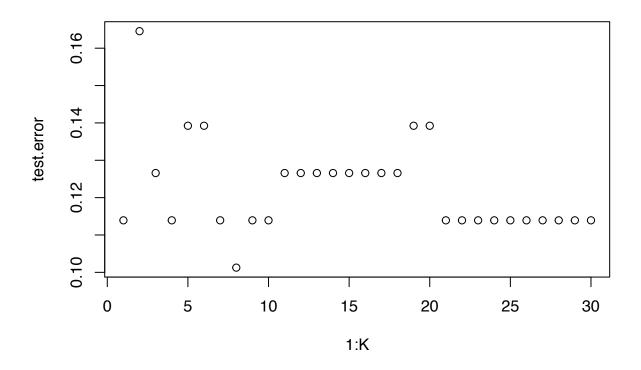

4.11

```
#a
mpg = Auto$mpg
mpg01 = rep(0, length(mpg))
for (i in 1:length(mpg)) {
   mpg01[i] = if(mpg[i] > median(mpg)) 1 else 0
}
dat = data.frame(mpg01 = mpg01, Auto)
#b
pairs(dat)
```

except for mpg, we see that cylinders, horsepower, weight, year and acceleration are most likely to be useful in predicting mpg01, because we observed a strong relationships between them.

```
# split ratio 8:2
set.seed(16)
train_ind <- sample(seq_len(nrow(dat)), size = nrow(dat)*0.8)</pre>
train <- dat[train_ind, ]</pre>
test <- dat[-train_ind, ]</pre>
fit = lda(mpg01 ~ cylinders + year + horsepower + weight + acceleration, data=train)
preds = predict(fit, test)
mean(preds$class != test$mpg01)
## [1] 0.06329114
#e QDA
fit = qda(mpg01 ~ cylinders +year + horsepower + weight + acceleration, data=train)
preds = predict(fit, test)
mean(preds$class != test$mpg01)
## [1] 0.1012658
#f logistic regression
fit = glm(mpg01 ~ cylinders + year + horsepower + weight + acceleration,
           family = "binomial", data = train)
preds = predict(fit, test, type = "response")
preds = preds > 0.5
mean(preds != test$mpg01)
## [1] 0.07594937
#q KNN
set.seed(16)
train.knn \leftarrow dat[train_ind, -c(1,2,4,9,10)]
test.knn <- dat[-train_ind, -c(1,2,4,9,10)]
K = 30
test.error = rep(0, K)
for (i in 1:K) {
 preds = knn(train.knn, test.knn, cl=dat[train_ind, "mpg01"], k = i)
  test.error[i] = mean(preds != test$mpg01)
plot(test.error, x=1:K)
```

which(test.error == min(test.error))

[1] 8

test.error[8]

[1] 0.1012658

we see K=8 give us the smallest test error

- (a) We need of limits additions so O(d) for atV

 We need of times multiplication, so O(d) for atV
 - (b) A has n.d elements AtB needs OCn.d) addition also needs O(n.d) space to store
 - (C) $A = \frac{d}{1} d(1)$ one multiplication needs d, there are n so AV is O(nd)ATB is $O(nd^2)$
 - (d) ATBV Method 1: (ATB) (ATB).V
 takes OCnd2, takes OCd2)
 O(nd2) dominant

Method 2: B.V ATCB-V)
takes O(nd). takes O(d-n)
So O(nd) after drops constance

the dominant terms

2. $(X^TX -) X^TX + \lambda I \longrightarrow (X^TX + \lambda I)^{-1}$ $O(nl^2) + O(l^2) + O(l^3) = O(l^3 + nl^2)$ (1)

3. if n >> l (2)'s complexity becomes $O(n^3)$, (1) is preferable if n << l (1)'s complexity becomes $O(l^3)$, (2) is preferable

- It I if I >> n, like the gene dataser, then we can use the kernel thick to reduce the computation cost
 - 2. Sometimes it's easier to deal with the data in transformal feature space, Such as predictors become linear in feature space, while not in the original space.

(c)
$$K(X_{1}z) = (H X_{1}z)^{2} + X_{1}z$$

 $= (H^{3}X_{1}z_{1} + 3X_{1}z_{1} + 2X_{1}z_{1}X_{1}z_{1} + X_{1}^{2}z_{1}^{2} + X_{1}^{2}z_{1}^{2})$
 $= (X_{1}^{2}, X_{1}^{2}, T_{2}X_{1}X_{2}, T_{3}X_{1}, T_{3}X_{1}, T_{3}X_{1}, T_{3}X_{1}, T_{3}X_{1}, T_{3}Z_{1}, T_{2}Z_{1}, T_{3}Z_{2}, T_{3}Z_{1}, T_{3}Z_{$

$$= (K(X_{1}, X_{1}_{new}), ..., K(X_{n}, X_{new})$$

intetting a nxn matrix is O(N3)

The two dominant costs are O(n3 + n2(1+logp))

(2) $\widehat{y}_{\text{new}} = \langle \phi_{\text{CXnew}} \rangle, \widehat{\phi} \rangle = \phi_{\text{CXnew}} [\Phi + \lambda Td] - \Phi^{T}y$ Mon-kernelized 更更 is olxal d n l the total computation for \$\overline{\Phi}\$ is \$\overline{\Quad}{\Phi}\$)

To while inverting alxal matter takes \$\overline{\Quad}{\Overline{\Quad}}\$) These two costs dominate, so the overall is O(d3+d2n) if n>>d, we prefer the non-kernelized, which is faster than the Kernelized if $n \ll d$, we prefer the Kernelized $(\bar{\Psi}^T \bar{\Psi} \uparrow \lambda \bar{l}_d)^T \bar{\Psi}^T y$, which has the cost lower than non-larnabled

(a)
$$\mathcal{Y} = \underset{K}{\operatorname{argmax}} P(Y=K) P(X|Y=K)$$

TCU() = PCY=K), PCX/Y=K) is multivariate normal

 $\frac{T(12)}{(2\pi)^{\frac{1}{2}}|z|^{\frac{1}{2}}} exp\left\{-\frac{1}{2}(X-U_{2})^{T} z^{-1}(X-U_{2})\right\} > \frac{1}{T(12)} exp\left\{-\frac{1}{2}(X-U_{1})^{T} z^{-1}(X-U_{1})\right\}$ $\int take log on both sides$

-1 (X-U2)TZ-1 (X-U2)+In(T(12)) + Constants >-1(X-U1)TZ-1(X-U1)+In(T(1))+ Constants

 $\chi^{T} \Sigma^{-1} U_{2} - \frac{1}{2} U_{2}^{T} \Sigma^{-1} U_{2} + \ln(\pi(2)) > \chi^{T} \Sigma^{-1} U_{1} - \frac{1}{2} U_{1}^{T} \Sigma^{-1} U_{1} + \ln(\pi(u))$

XTE-1(U2-U1) 7 = U1=102 - = UTE-1U1+1n(N1)-1n(N2)

if left tikelihood > right hand side likelihood, we classify to class 2 In (Ni) if left < right, we classify to class 1

$$\begin{array}{ccc} (X^{T}X)\beta = X^{T}Y \\ \begin{pmatrix} I^{T} & I^{T} \\ X^{(1)} & X^{(1)} \end{pmatrix} \begin{pmatrix} I & X^{(1)} \\ I & X^{(1)} \end{pmatrix} \begin{pmatrix} \beta_{0} \\ \beta \end{pmatrix} = \begin{pmatrix} 1^{T} & I^{T} \\ X^{(1)T} & X^{(1)T} \end{pmatrix} \begin{pmatrix} N/N_{2}I \\ -N/N_{1}I \end{pmatrix}$$

 $\begin{pmatrix} N & N_1 \hat{\mathbf{u}}_1^{\mathsf{T}} + N_2 \hat{\mathbf{u}}_2^{\mathsf{T}} \\ N_1 \hat{\mathbf{u}}_1 + N_2 \hat{\mathbf{u}}_2 & \chi^{(1)\mathsf{T}} \chi^{(2)} + \chi^{(1)\mathsf{T}} \chi^{(2)} \end{pmatrix} \begin{pmatrix} \beta_0 \\ \beta \end{pmatrix} = \begin{pmatrix} O & N\beta_0 + (N\Omega_1^{\mathsf{T}} + N_2 \hat{\mathbf{u}}_2^{\mathsf{T}}) \beta = O & \mathcal{D} \\ N(\hat{\mathbf{u}}_2 - \hat{\mathbf{u}}_1) \end{pmatrix}$

 $\chi^{(2)T}\chi^{(2)} + \chi^{(1)T}\chi^{(1)} = \overline{\chi}^{(2)T}\overline{\chi}^{(2)} + \overline{\chi}^{(1)T}\overline{\chi}^{(2)} + N_i\Omega_i\Omega_i^T + N_i\Omega_i^T + N_i\Omega_i\Omega_i^T + N_i\Omega_i^T + N_$

 $(N_i\hat{u}_i + N_i\hat{u}_i)\beta_0 + (N_i - 2)\hat{\Sigma} + N_i\hat{u}_i\hat{u}_i + N_i\hat{u}_i\hat{u}_i)\beta_0 = N(\hat{u}_i - \hat{u}_i)$ plug in O

 $[(N-2)\hat{\Sigma} + \frac{N_1N_2}{N}(\Omega_1 - \Omega_1)(\Omega_1 - \Omega_1)]\beta = N(\Omega_1 - \Omega_1)$

(C) from part (b) we have

$$(N-2) \stackrel{?}{\geq} \not + \frac{N_1 N_1}{N} (\Omega_2 - \Omega_1) (\Omega_2 - \Omega_1)^T \not = N(\Omega_2 - \Omega_1)$$

Since $(\Omega_2 - \Omega_1)^T \not \beta$ is scalar

 $\stackrel{?}{\leq} \not \beta$ is a linear combination of $\Omega_2 - \Omega_1$, and $\stackrel{?}{\leq} \not \beta \not \beta$ is a multiple of $\Omega_2 - \Omega_1$

hence this in the direction of $\Omega_1 - \Omega_1$
 $\stackrel{?}{\leq} \not \sim \stackrel{?}{\leq} \stackrel{?}{\sim} (\Omega_1 - \Omega_1)$

(d) Since in part (b) and (c), we assume labels are silifferent, so if two classes are distinct, BX &-1 (u-u), still holds.

(e)
$$\mathcal{P} = \lambda \mathcal{Z}^{-1}(\Omega_1 - \Omega_1)$$
 $\mathcal{P}_0 = -\frac{\lambda}{N} \mathcal{L}(N_1 + N_2 \Omega_2 + \Omega_1)$ $\mathcal{P}_0 = \lambda \mathcal{Z}^{-1}(\Omega_1 - \Omega_1)$ $\mathcal{P}_0 = \lambda \mathcal{Z}^{-1}(\Omega_1$
